ARGUS - 4-Minute Demo Video Script

Team: Binary Builders - Pawan Singh Bhandari & Rahul Bramhankar

Before recording: run one full assessment end-to-end first (ask Claude to re-run `lab_init.ps1`, then run a request through the UI) so Findings and the Report are already populated when you start recording. You are narrating a real, completed run - not waiting on a live scan on camera.

0:00-0:15 - Intro (no screen needed yet)

> *"Hi, we're Binary Builders. This is ARGUS - an AI agent that runs real penetration tests and writes the report itself."*

0:15-0:40 - The request (type it live)

- Type: `Assess the lab network 10.77.0.0/24 for web application vulnerabilities. No denial of service.`
- Click **Check scope and make a plan**.

> *"It checks the target is actually authorized before doing anything."*

0:40-1:05 - The plan

- Point at 2 steps in the plan and their reasons.

> *"Every step comes with a reason - it's not a fixed script, it's deciding."*

1:05-1:30 - Findings tab

- Click **Findings**.

> *"Multiple tools reporting the same bug get merged into one finding, not duplicates."*

- Click into one finding, point at confidence + evidence.

1:30-1:55 - A refuted finding

- Click a refuted finding.

> *"This looked real, ARGUS double-checked it, and ruled it out itself."*

1:55-2:20 - Risk ranking

- Click top finding, scroll to the priority score.

> *"Risk isn't a guess - every factor in this score is shown."*

2:20-2:50 - The safety gate

- Go to **Approvals** tab.

> *"Anything that actively tests a bug - not just looks - waits for a human here. That's the safety rule."*

- Type name, click **Approve**.

2:50-3:20 - The real finding

- Go back to **Findings**, show the SQLi or XSS result.

> *"That's a real SQL injection, found live on our test target - not staged."*

3:20-3:50 - The report

- **Report** tab -> **Download PDF** -> scroll it fast (summary, findings table, limitations page).

> *"It all becomes one client-ready report - honest about limitations too."*

3:50-4:00 - Close

> *"That's ARGUS. Thank you."*

If something goes wrong on camera

- **A scan seems stuck:** cut it in editing, or talk over it using the architecture slide from the deck.
- **A tool shows "unavailable":** say "that's a safety feature - if a tool fails, ARGUS reports the gap honestly instead of hiding it," then move on.
